Ultrasound-guided Filler Injections

Mapping & Injecting

Provide injections as safely as possible by knowing how deep each blood vessel is with a great certainty.

Evaluating Fillers

Ultrasound can scan the product that has been injected in the past. The product can sometimes cause prolonged swelling or irregularities in the skin. When doctors need to dissolve the injected material, the ultrasound can help them inject hyaluronidase (used to dissolve fillers) precisely. Can help optimize the treatment and dissolve the filler.

The C10MB Pro can be used for all injections in the area of face and neck, including (but not limited to) Botox, lip injections, liquid rhinoplasty, Kybella fat reduction, chin/jawline filler, undereye filler and nasolabial fold filler.
